

DUSKWatch USB Control

To prevent your mobile data from getting into the wrong hands

Mobile Data Protection

DUSKWatch USB Control allows for selecting USB storage devices that can be connected to networks. Prioritize the protection and privacy of your outgoing data by controlling USB removable devices.

Transparent and Continuous Control

DUSKWatch USB Control offers a security mechanism that guarantees that data will not be made accessible to an indefinite number of users. Completely transparent and without user interface, it controls USB ports by filtering the keys, USB thumb drives or flash-drives of your choice.

Increased Knowledge of USB Activities

The activity reports usefully identify the most vulnerable workstations to illegal intrusions. These reports help determine privacy risks. When combined with DUSK-USB protection, shadow copies of outgoing files may even be captured. Be in a position to react quickly in case of emergency.

Customised Privileges

Whether granting collaborators specific privileges or limiting the use of protected devices to network to prevent unauthorized data introduction, the DUSKWatch USB Control solution can easily be tailored to users' needs.

When combined with the use of USB disks secured by DUSK-USB Protection, the DUSKWatch USB Control allows you to:

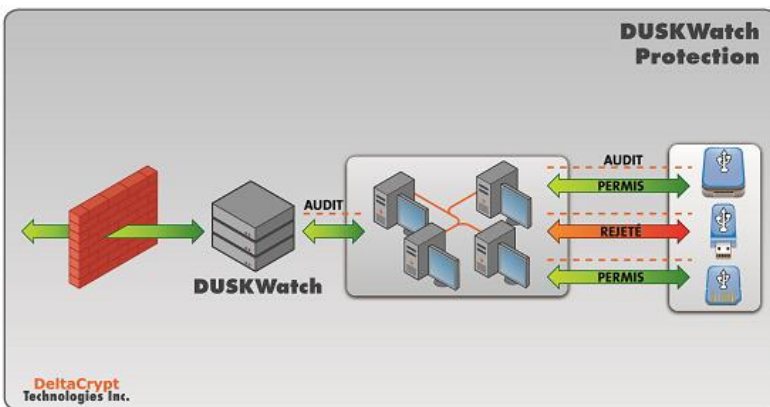

- Get the assurance that mobile data remains confidential at all times
- Reduce security vulnerabilities
- Increase environmental knowledge
- Prevent leaks and illegal intrusions
- React quickly in case of data leaks
- Group USB disks and assign specific permissions to each group
- Comply with data security practices and codes of conduct
- Demonstrate the compliance regulatory requirements for data protection
